Chapter 9

THE PROCESS OF INTERACTION DESIGN
Overview

• What is involved in Interaction Design?
  – Importance of involving users
  – Degrees of user involvement
  – What is a user-centered approach?
  – Four basic activities

• Some practical issues
  – Who are the users?
  – What are ‘needs’?
  – Where do alternatives come from?
  – How to choose among alternatives?
  – How to integrate interaction design activities in other lifecycle models?
What is involved in Interaction Design?

• It is a process:
  – a goal-directed problem solving activity informed by intended use, target domain, materials, cost, and feasibility
  – a creative activity
  – a decision-making activity to balance trade-offs

• Generating alternatives and choosing between them is key

• Four approaches: user-centered design, activity-centered design, systems design, and genius design
Importance of involving users

• Expectation management
  – Realistic expectations
  – No surprises, no disappointments
  – Timely training
  – Communication, but no hype

• Ownership
  – Make the users active stakeholders
    • More likely to forgive or accept problems
  – Can make a big difference to acceptance and success of product
Degrees of user involvement

• Member of the design team
  – Full time: constant input, but lose touch with users
  – Part time: patchy input, and very stressful
  – Short term: inconsistent across project life
  – Long term: consistent, but lose touch with users

• Newsletters and other dissemination devices
  – Reach wider selection of users
  – Need communication both ways

• User involvement after product is released

• Combination of these approaches
What is a user-centered approach?

User-centered approach is based on:

- Early focus on users and tasks: directly studying cognitive, behavioral, anthropomorphic & attitudinal characteristics

- Empirical measurement: users’ reactions and performance to scenarios, manuals, simulations & prototypes are observed, recorded and analysed

- Iterative design: when problems are found in user testing, fix them and carry out more tests
Early Focus on Users & Tasks

- Users’ tasks and goals are the driving force behind development.
- Users’ behavior and context of use are studied.
- Users’ characteristics are captured and designed for.
- Users are consulted throughout development.
- All design decisions are taken within the context of the users, their work and environment.
Four basic activities in Interaction Design

1. Establishing requirements
2. Designing alternatives
3. Prototyping
4. Evaluating
A simple interaction design lifecycle model

Exemplifies a user-centered design approach

**Figure 9.3** A simple interaction design lifecycle model
Some practical issues

• Who are the users?
• What do we mean by ‘needs’?
• How to generate alternatives
• How to choose among alternatives
• How to integrate interaction design activities with other lifecycle models?
Who are the users/stakeholders?

• Not as obvious as you think:
  – those who interact directly with the product
  – those who manage direct users
  – those who receive output from the product
  – those who make the purchasing decision
  – those who use competitor’s products

• Three categories of user (Eason, 1987):
  – primary: frequent hands-on
  – secondary: occasional or via someone else
  – tertiary: affected by its introduction, or will influence its purchase
Who are the stakeholders?

- Suppliers
- Local shop owners

Check-out operators

Managers and owners

Customers

What do we mean by ‘needs’?

• Users rarely know what is possible

• Users often can’t tell you what they ‘need’ to help them achieve their goals

• Instead, look at existing tasks:
  – their context
  – what information do they require?
  – who collaborates to achieve the task?
  – why is the task achieved the way it is?

• Envisioned tasks:
  – can be rooted in existing behaviour
  – can be described as future scenarios
How to generate alternatives

• Humans stick to what they know works

• But considering alternatives is important to ‘break out of the box’

• Designers are trained to consider alternatives, software people generally are not

• How do you generate alternatives?
  
  — ‘Flair and creativity’: research and synthesis
  
  — Seek inspiration: look at similar products or look at very different products
IDEO TechBox

- Library, database and website all-in-one
- Contains physical gizmos for inspiration
The TechBox

04. Each drawer resembles a bento box
05. The curator keeps order
06. All the entries are tagged
07. It really is used daily
08. Two demonstrations units on top

How to choose among alternatives

- Evaluation with users or with peers, e.g. prototypes
- Technical feasibility: some not possible
- Quality thresholds: Usability goals lead to usability criteria set early on and check regularly
  - safety: how safe?
  - utility: which functions are superfluous?
  - effectiveness: appropriate support? task coverage, information available
  - efficiency: performance measurements
  - learnability: is the time taken to learn a function acceptable to the users?
  - memorability: can infrequent users remember how to achieve their goal?
Testing prototypes to choose among alternatives
How to integrate interaction design in other models

• Integrating interaction design activities in lifecycle models from other disciplines needs careful planning
• Several software engineering lifecycle models have been considered
• Integrating with agile software development is promising
  – it stresses the importance of iteration
  – it champions early and regular feedback
  – it handles emergent requirements
  – it aims to strike a balance between flexibility and structure
Summary

Four basic activities in the design process

1. Establishing requirements
2. Designing alternatives
3. Prototyping
4. Evaluating

User-centered design rests on three principles

1. Early focus on users and tasks
2. Empirical measurement using quantifiable & measurable usability criteria
3. Iterative design
